Supplementary information for: Real time human micro-organisms biotyping based on Water-Assisted Laser Desorption/Ionization

**Supp. Data 1:** Time course SpiderMass analyses from T0 to T8 hours of E. Coli growths in liquid suspension were performed on agarose of a petri dish. 10 µl of the suspension collected at T0 and at T8h are harvested and dropped on agarose of a petri dish SpiderMass analyses were performed in negative and positive modes. (Duplicates are presented for each conditions).
